***CORSO di LAUREA in TECNICHE di RADIOLOGIA
MEDICA, per IMMAGINI e RADIOTERAPIA***

Contrasto & Sequenze

05 05 2012

Paolo Vespa

Contenuti:

- * Sequenze ad impulsi:
 - * Spin Echo Pulse Sequence (SE)
 - * Turbo Spin Echo (TSE)
 - * Fast Field echo (FFE)
 - * Echo Planar Imaging (EPI)
 - * Gradient and Spin Echo (GRASE)
- * Preimpulsi:
 - * STIR
 - * SPIR
 - * FLAIR

Fattori determinanti il contrasto in MRI

L'intensità del segnale RM è determinata da:

- * caratteristiche del tessuto
- * settaggio apparecchiature

Caratteristiche RM dei tessuti

Il **contrasto** nelle immagini è basato su:
differenze caratteristiche dei tessuti:

- * Proton Density
- * Longitudinal Relaxation Time T1
- * Transverse Relaxation Time T2

altre caratteristiche:

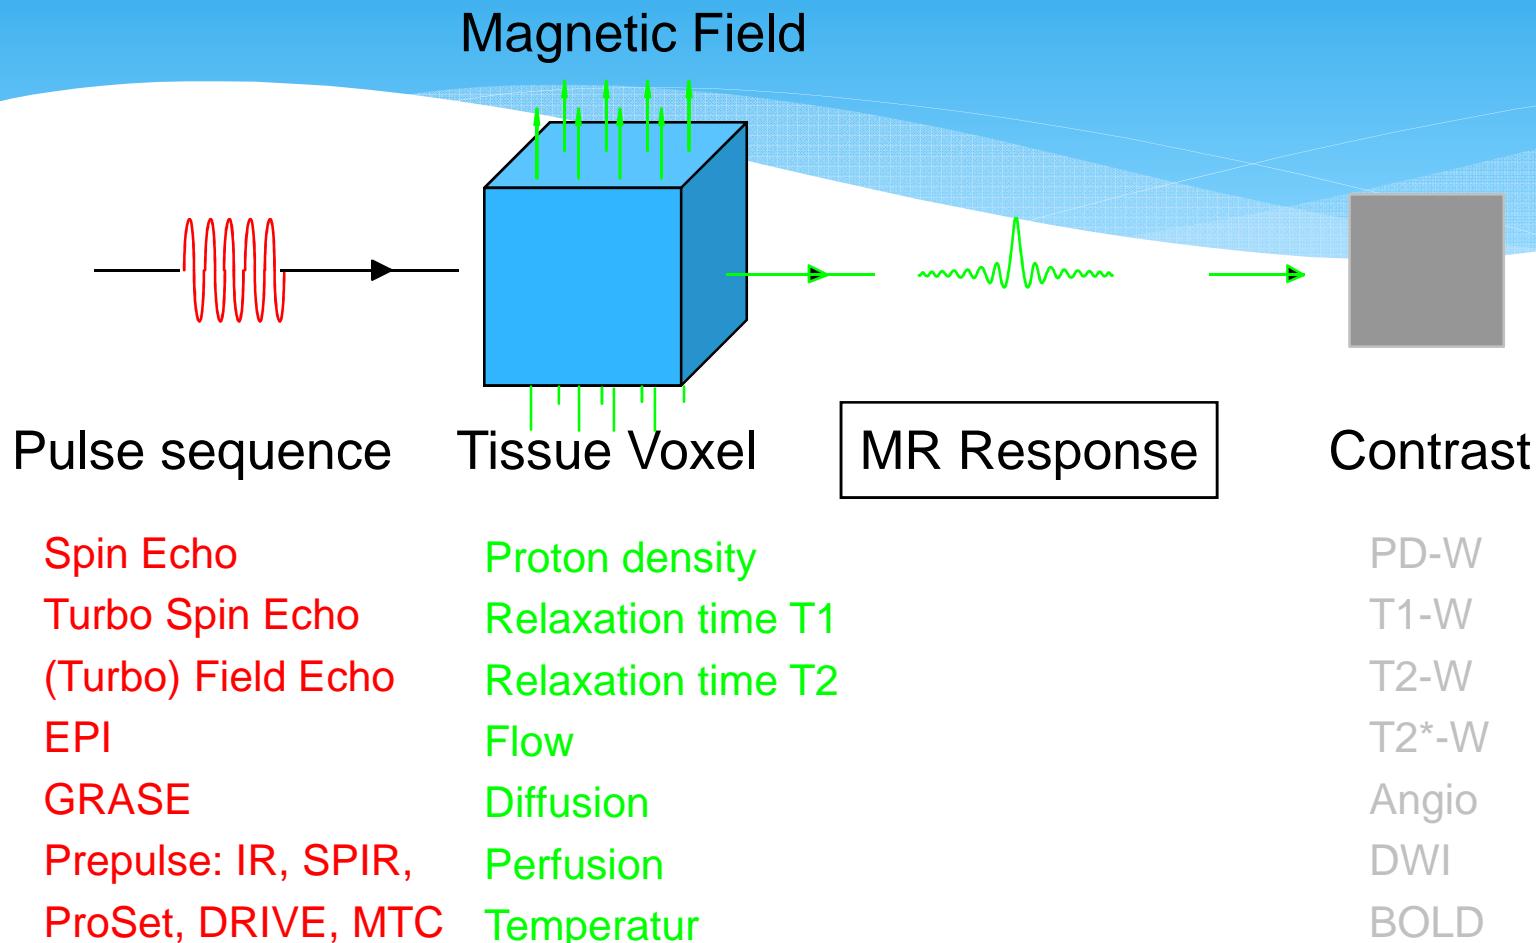

- * Flow
- * Diffusion
- * Contrast agent/perfusion
- * Magnetization transfer contrast
- * Temperature

Caratteristiche RM dei tessuti

Tecniche di soppressione del segnale dei tessuti:

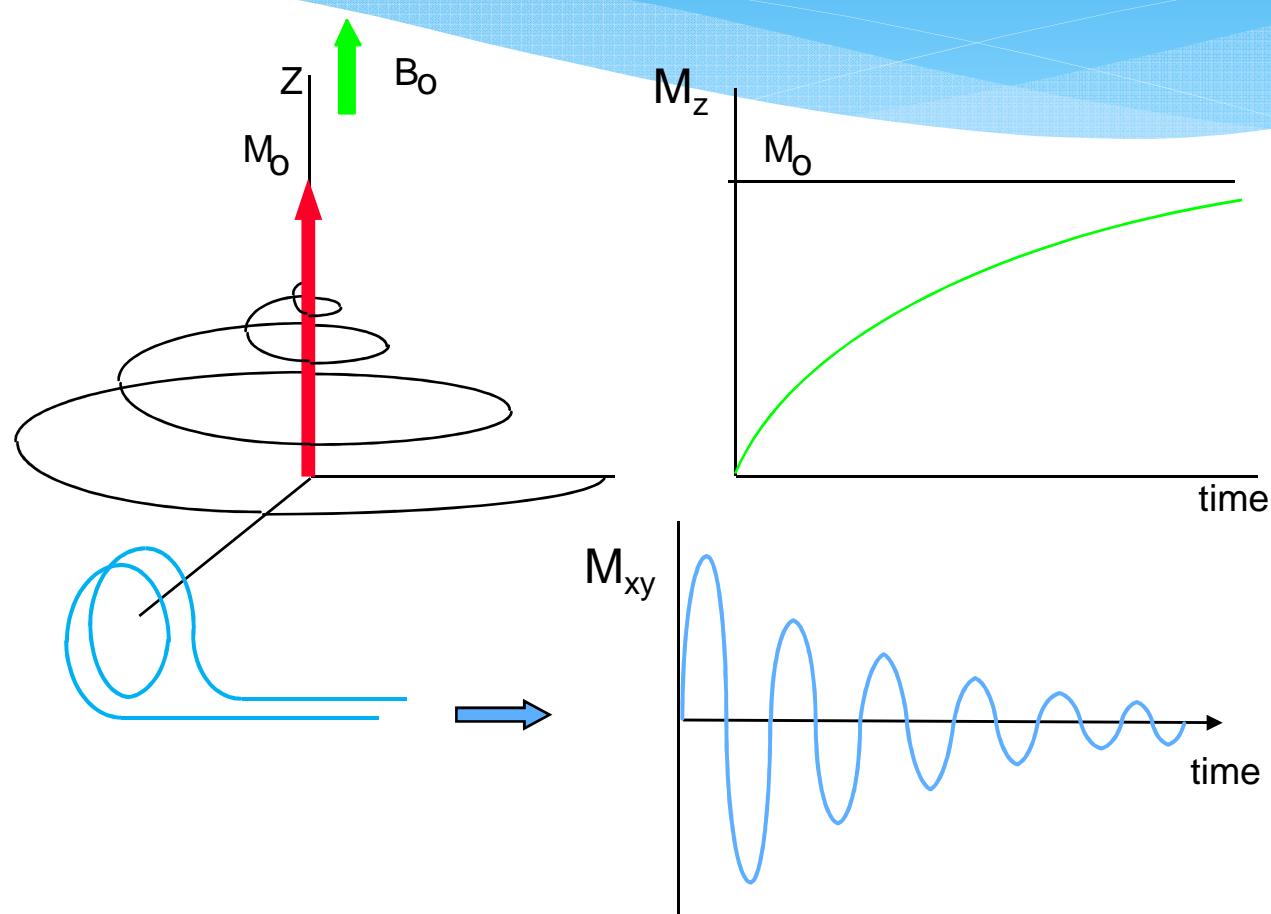

- * Fat suppression (STIR, SPIR)
- * Fluid attenuation (FLAIR)

Contrasto tissutale

Caratteristiche del segnale RM

Rilassamento T1

Caratteristiche RM del tessuto

Tissue	Proton density	T1 (msec)	T2 (msec)
Adipose	100	260	85
Bone marrow	40	400	60
White matter	85	790	90
Grey matter	80	920	100
Blood	95	1200	100
CSF	100	>4000	>2000
Cortical bone	<10		
Air	<1		

Settaggio della strumentazione

→ Tipo di sequenze ad impulsi

- (Turbo) Spin Echo ($90^\circ - 180^\circ$)
- Inversion Recovery ($180^\circ - 90^\circ - 180^\circ$)
- (Turbo) Field Echo
- EPI
- GRASE

→ Pulse sequence characteristics

→ Signal preparation

Settaggio della strumentazione

- ➔ Tipo di sequenze ad impulsi
- ➔ Pulse sequence timing
- ➔ Signal preparation

Settaggio della strumentazione

➔ Type of pulse sequence

➔ Settaggio parametri sequenze:

- repetition time (TR)
- echo time (TE)
- inversion time (TI)
- flip angle

➔ Signal preparation

Settaggio della strumentazione

- ➔ Type of pulse sequence
- ➔ Temporizzazione sequenze ad impulsi
- ➔ Signal preparation

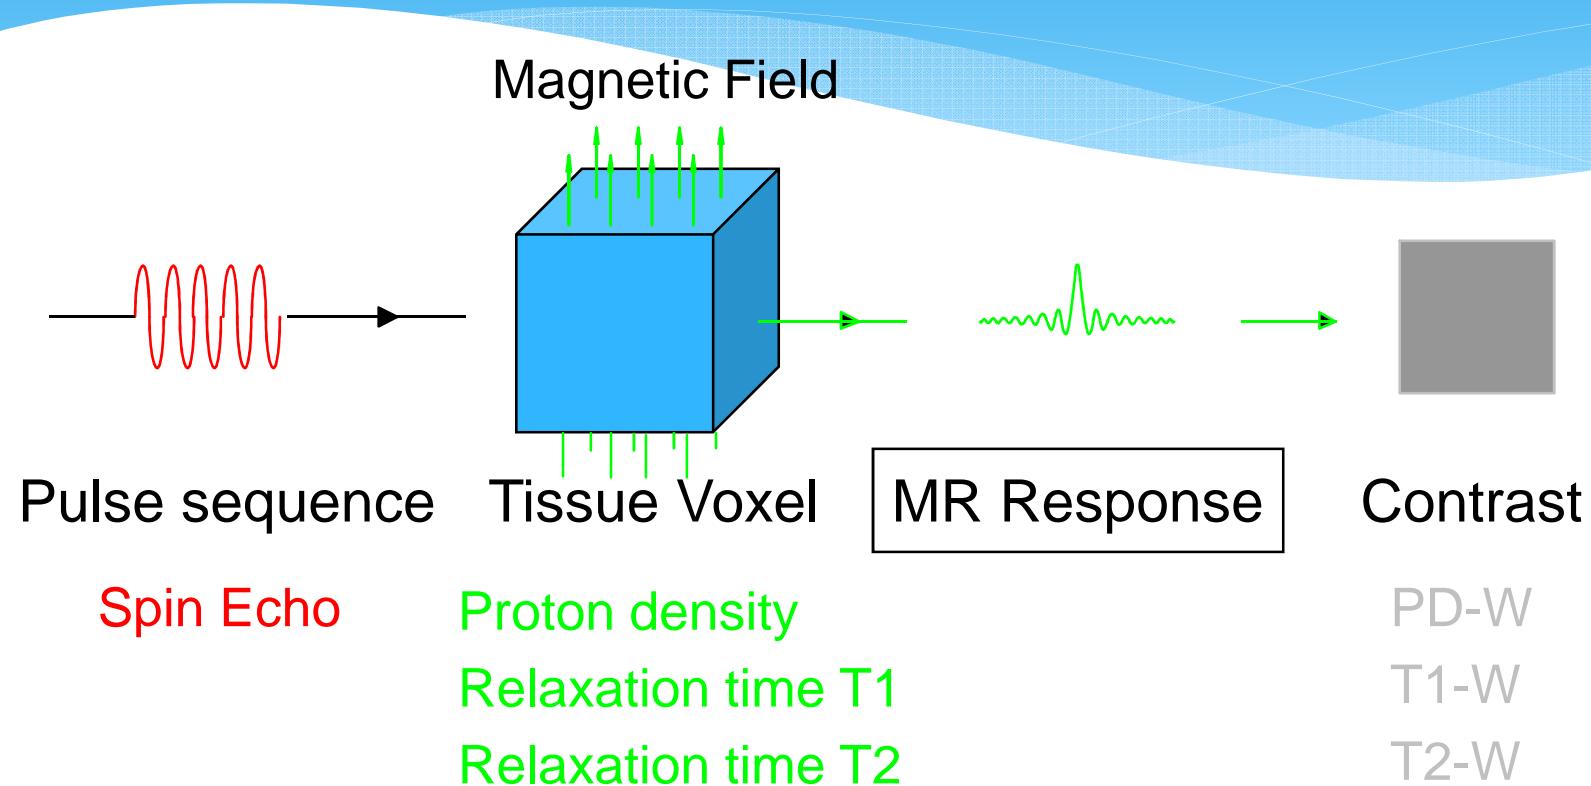

Settaggio della strumentazione

- ➔ Type of pulse sequence
- ➔ Pulse sequence timing
- ➔ Preparazione del segnale
 - Fat suppression (STIR, SPIR, ProSet)
 - Fluid attenuation (FLAIR)
 - Dual Inversion
 - DRIVE
 - MTC

T2W

PDW

Spin Eco

Sequenza ad impulsi

Spin Echo (SE)

Spin Eco

Sequenza ad impulsi

- * Contrast in Spin Echo images è un mix di:
 - * T₁
 - * T₂
 - * proton density
- * Selezionando le variazioni dei tempi TR e TE si determina la predominanza di:
 - * T₁-weighted
 - * T₂-weighted
 - * proton-density-weighted

Spin Eco Contrasto

Le immagini spin eco possono mostrare differenti tipi di contrasto:

	Short TR	Long TR
Short TE	T1-weighted	PD-weighted
Long TE	Non constructive	T2-weighted

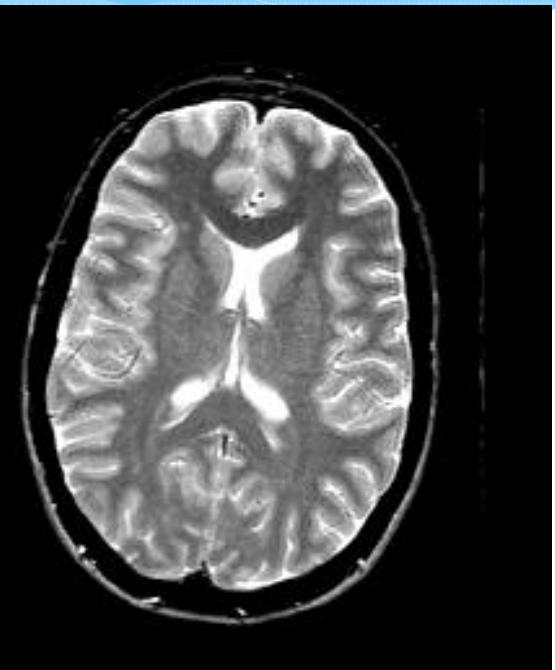

Contrasto in SE

Long TR, short TE
Proton density

Short TR, short TE
T1-weighted

Long TR, long TE
T2-weighted

Come appaiono le immagini clinicamente

T1 Effects on Image

Short T1 - bright

- Fat, subacute bleeding
- paramagnetic contrast agents (gadolinium)

Long T1 - dark

- neoplasm, edema, inflammation, pure fluid, CSF

Come appaiono le immagini clinicamente

T2 Effects on Image

Short T2 - dark

- Iron deposition in liver, magnetic susceptibility effect

Long T2 - bright

- Neoplasm, edema, inflammation, gliosis, pure fluid, CSF

Come appaiono le immagini clinicamente

Proton density effects

Low proton density - dark

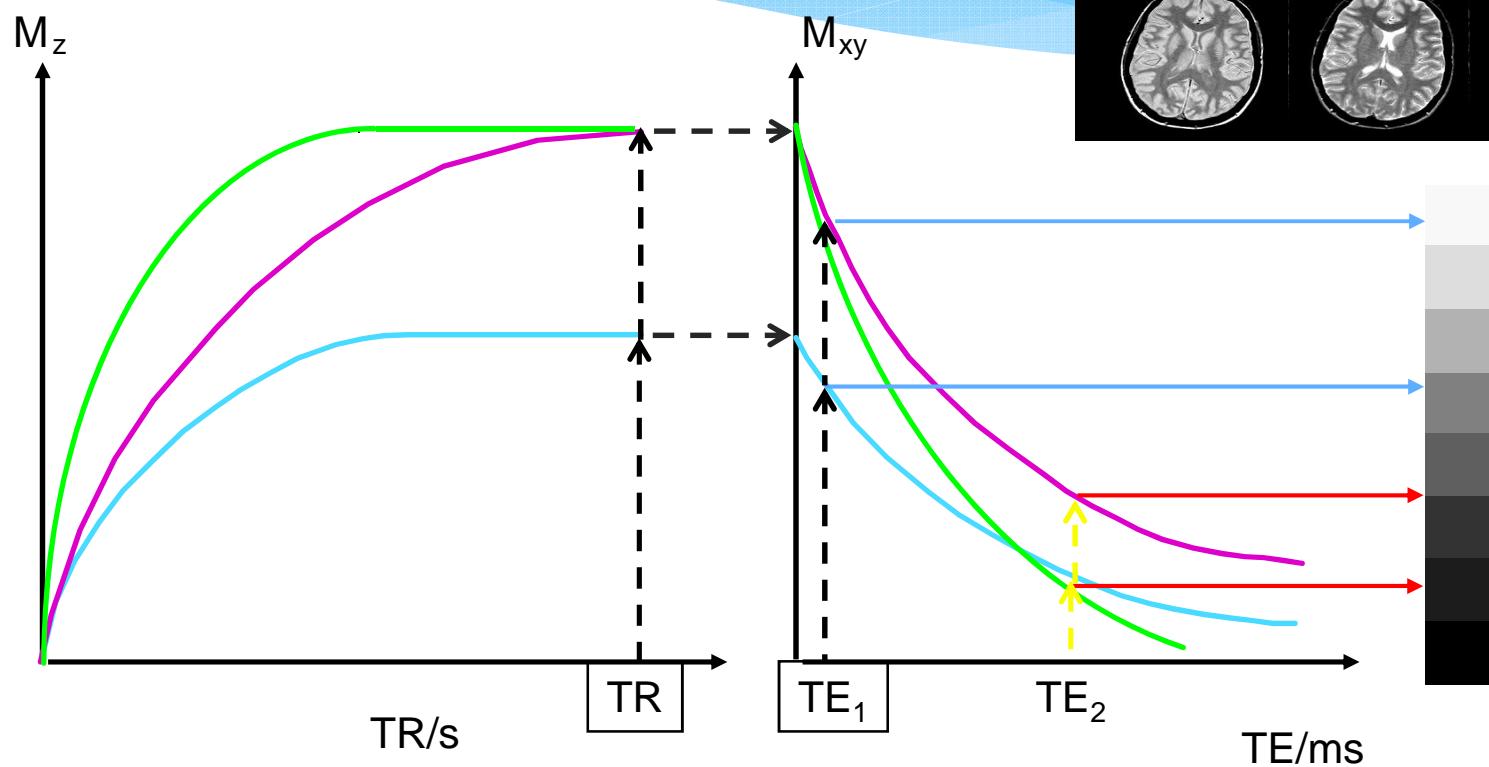

- calcium, air, cortical bone, fibrous tissue

High proton density - bright

- fat

Doppio Eco Spin Echo

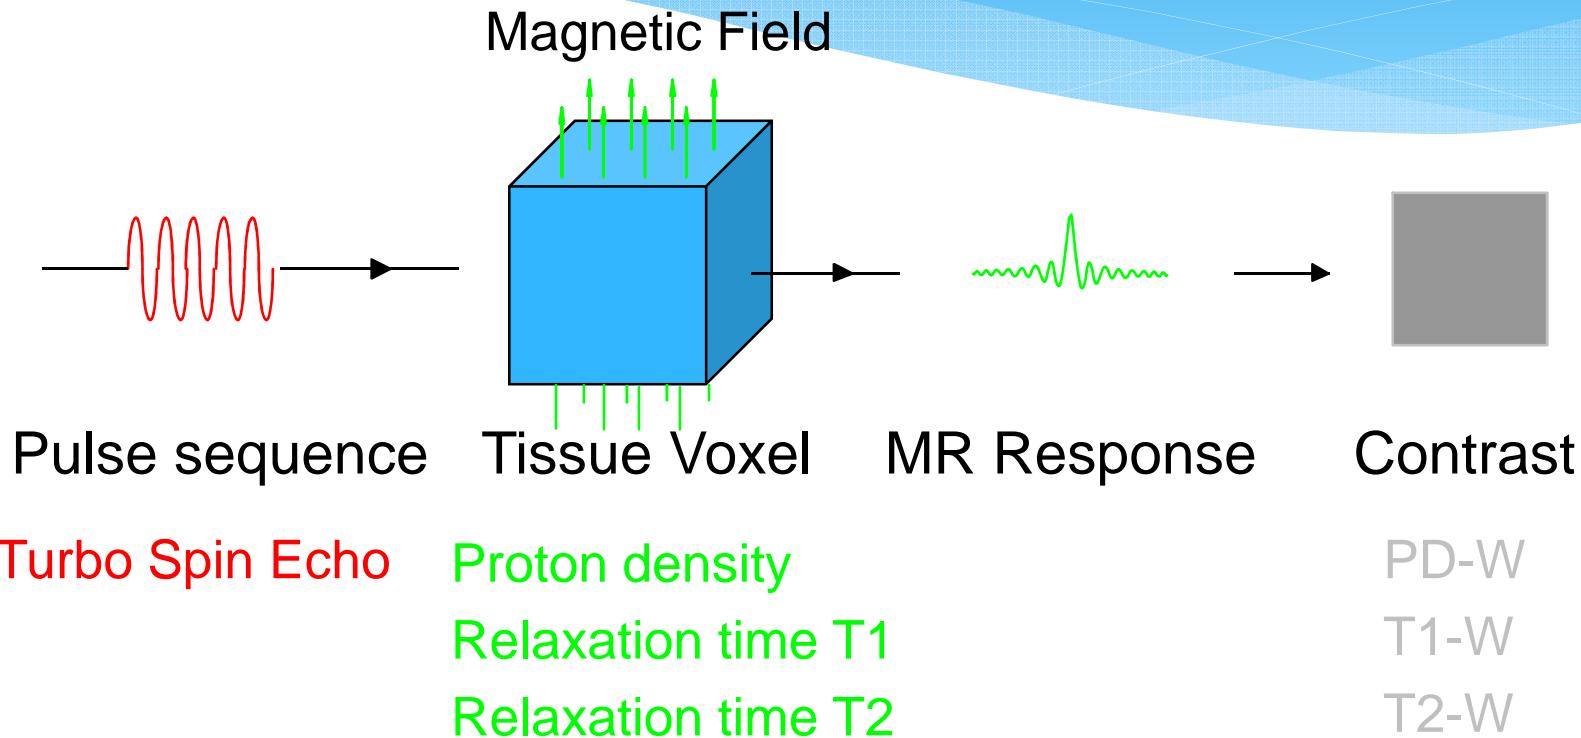

Long TR, Short TE/Long TE

Riassumendo: Spin Eco

- * **Vantaggi:**
 - + eliminano la perdita di segnale causata da:
 - * disomogeneità del campo magnetico
 - * suscettibilità
 - * chemical shift
 - + determinano un eccellente contrasto T2
 - + "golden standard"
- * **Svantaggi:**
 - * tempi di acquisizione
 - * sensibilità agli artefatti da movimento

Contrasto nelle Turbo Spin Eco

Sequenze Turbo

Introduzione

Tecniche di immagine:

- * Imaging convenzionale
- * Sequenze turbo o fast

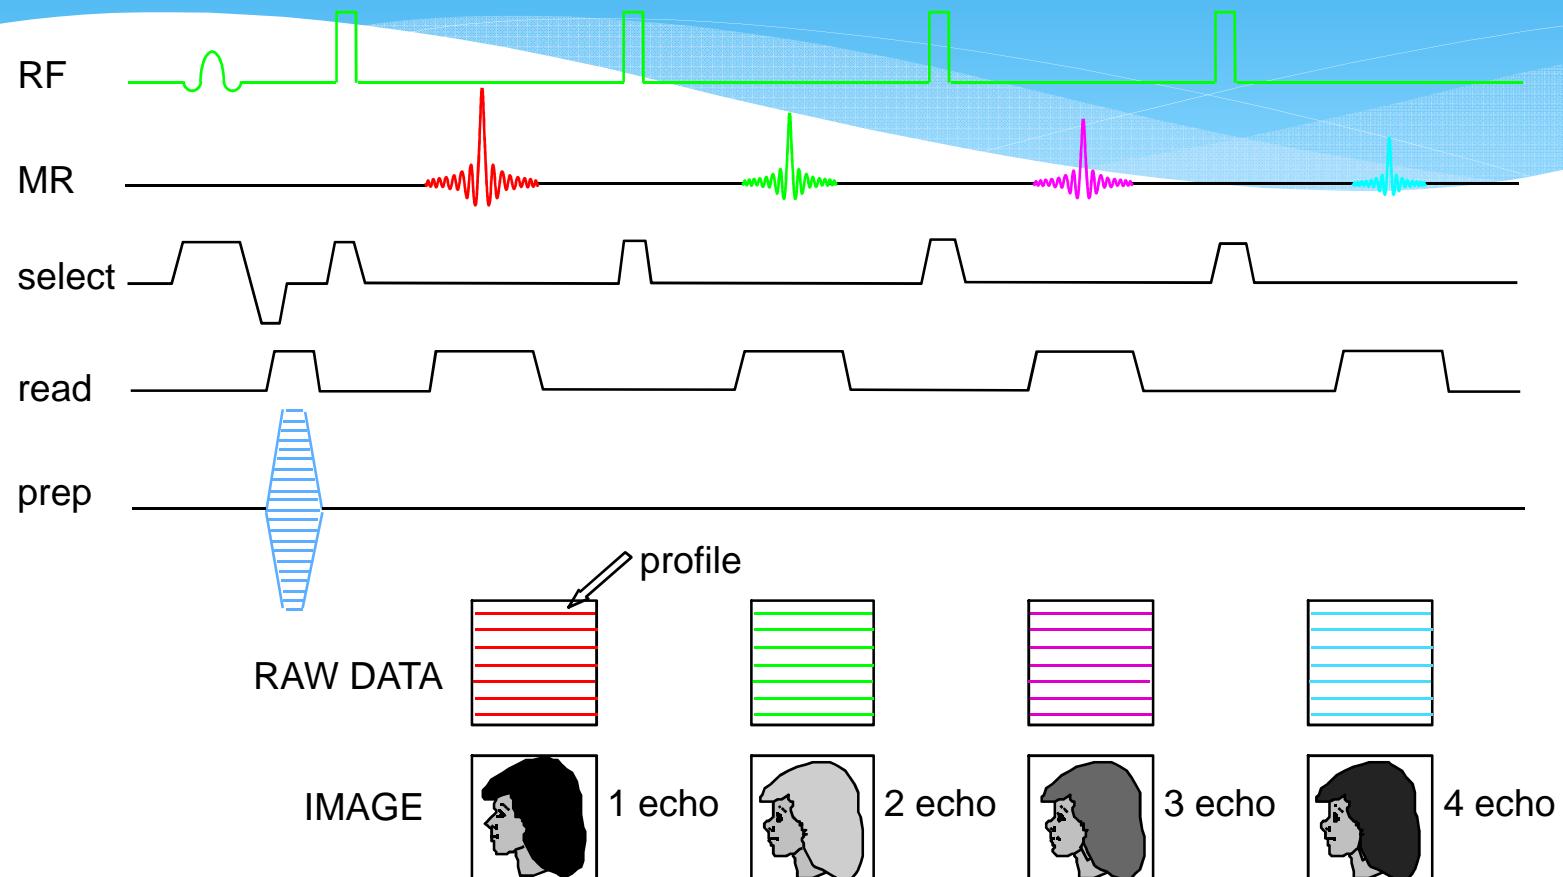

Sequenze di imaging **convenzionali** (e.g. SE, IR or FE):

one excitation \Rightarrow one phase encoding (profile)

Sequenze **turbo** (TSE, GRASE, EPI)

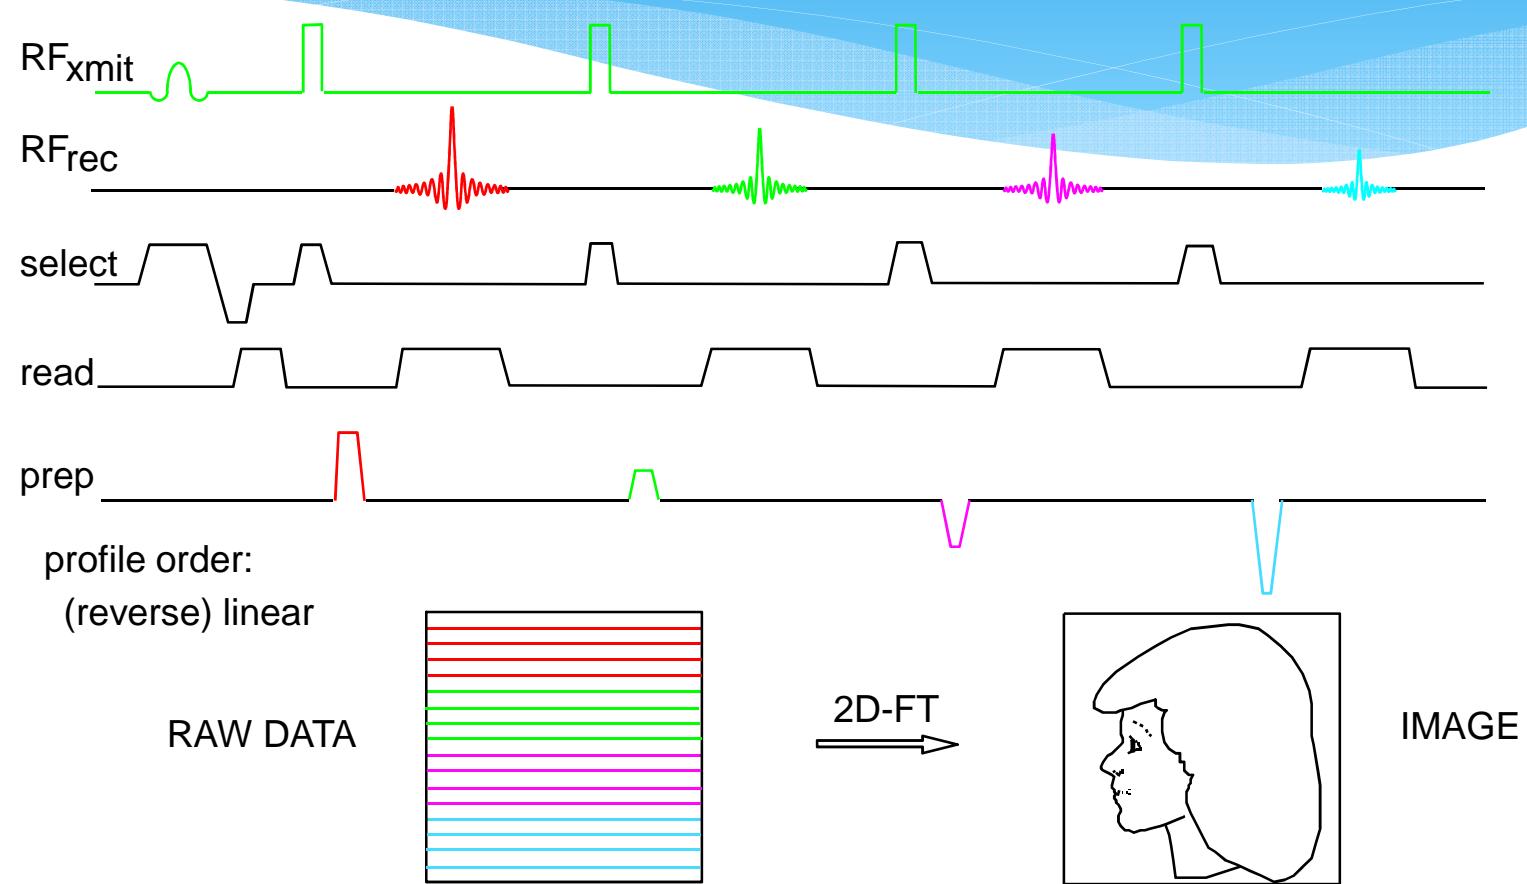

one excitation \Rightarrow multiple phase encodings (profiles)

Spin echo convenzionale con 4 echi equidistanti

Turbo Spin Eco

Turbo factor 4

Confronto performance SE vs TSE:

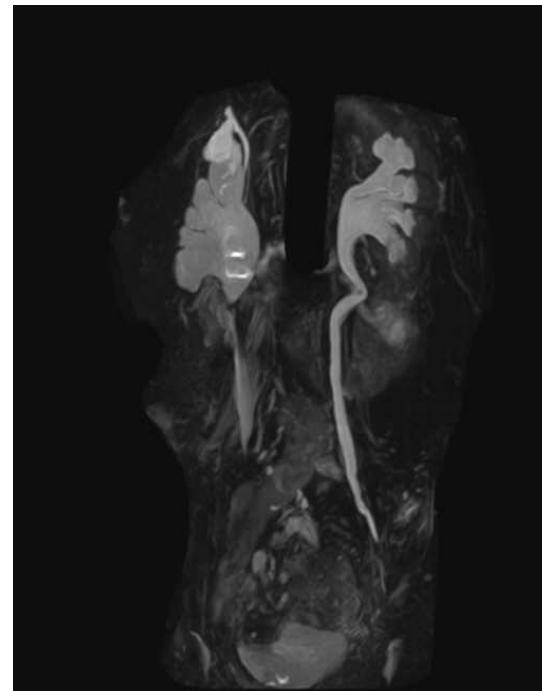

- * Spin Echo 256^2
TR = 2000 ms, 256×256 matrix, NSA = 2 17.06 min
- * Turbo Spin Echo 256^2
TR = 2000 ms, 256×256 , NSA = 2, TSE factor 10 1.7 min

- * Spin Echo 512^2
TR = 2000, 512×512 matrix, NSA = 2 34.14 min
- * Turbo Spin Echo 512^2
TR = 2000, 512×512 matrix, NSA = 2, TSE factor 10 3.4 min

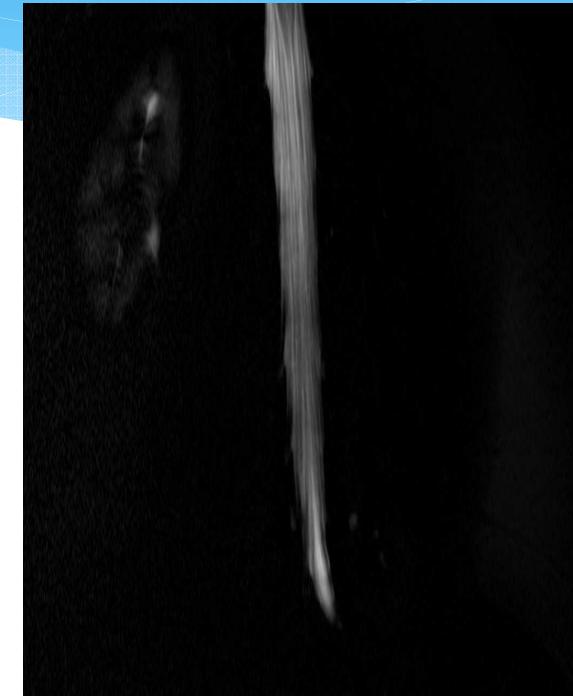

Applicationi speciali delle TSE

MRCP

PieloRM

MR myelography

Riassumendo: Turbo Spin Eco

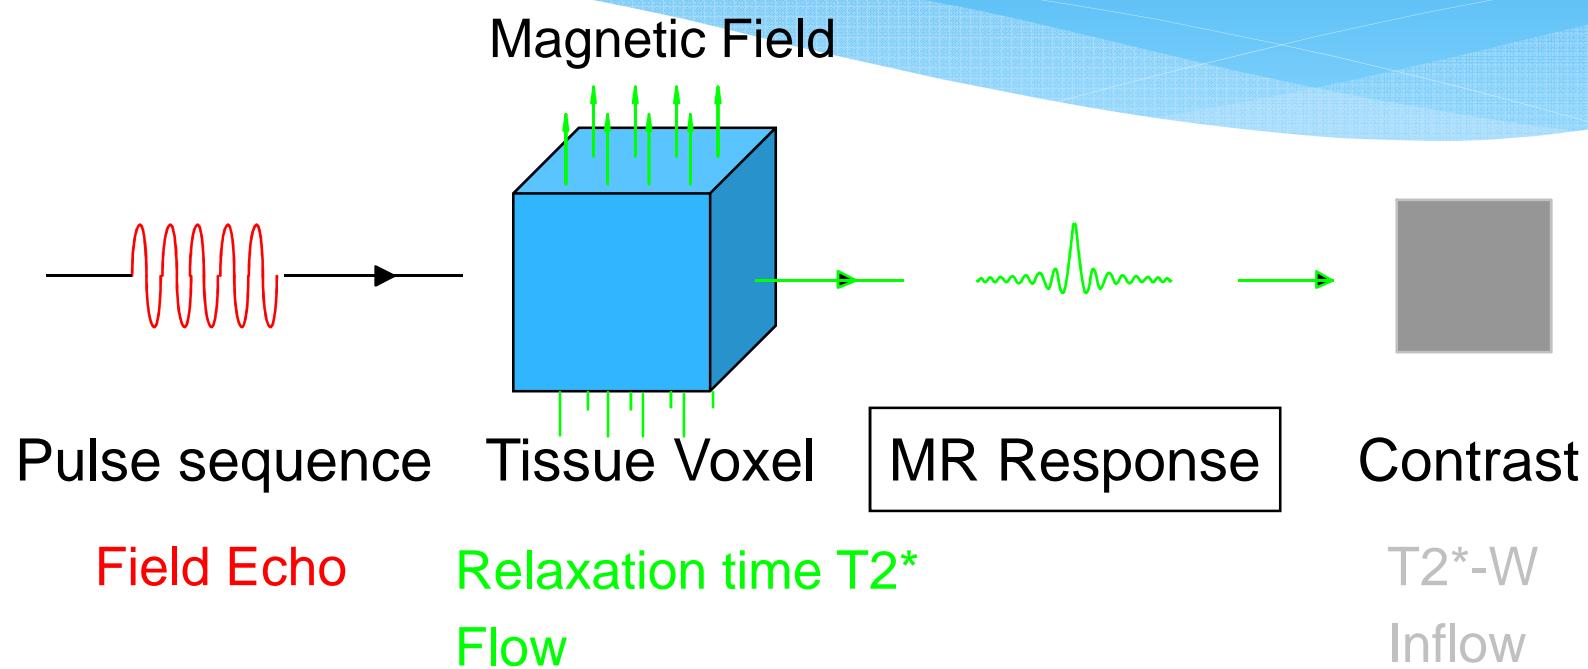

Vantaggi:

- + riduzione tempo di acquisizione
- + eccellenti immagini T2 weighted
- + eliminazione contaminazione T1 grazie al TR lungo
- + facile implementazione senza aggiunta di hardware

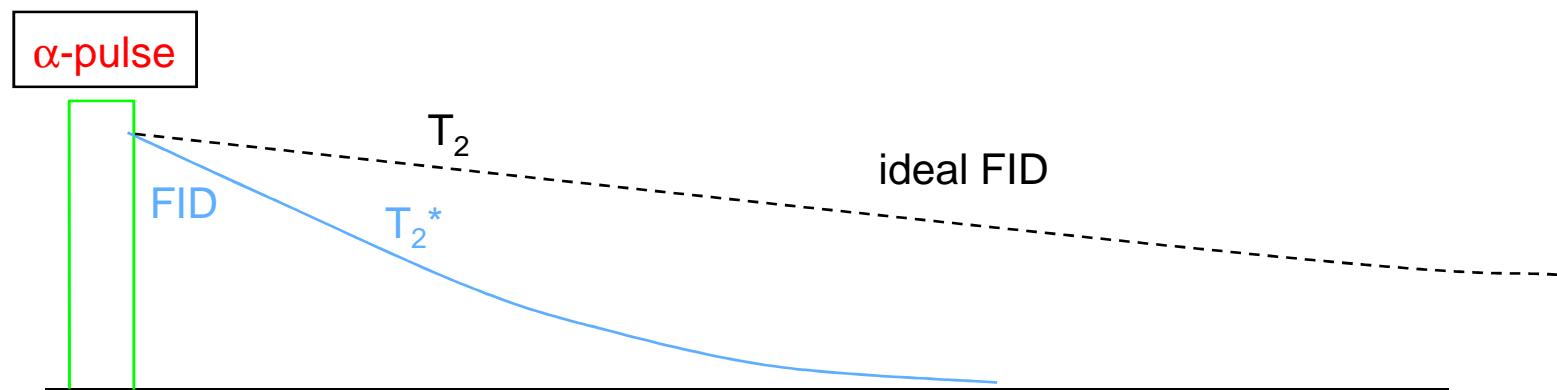

Svantaggi:

- + Alto valore SAR
- + iperintensità tessuto adiposo

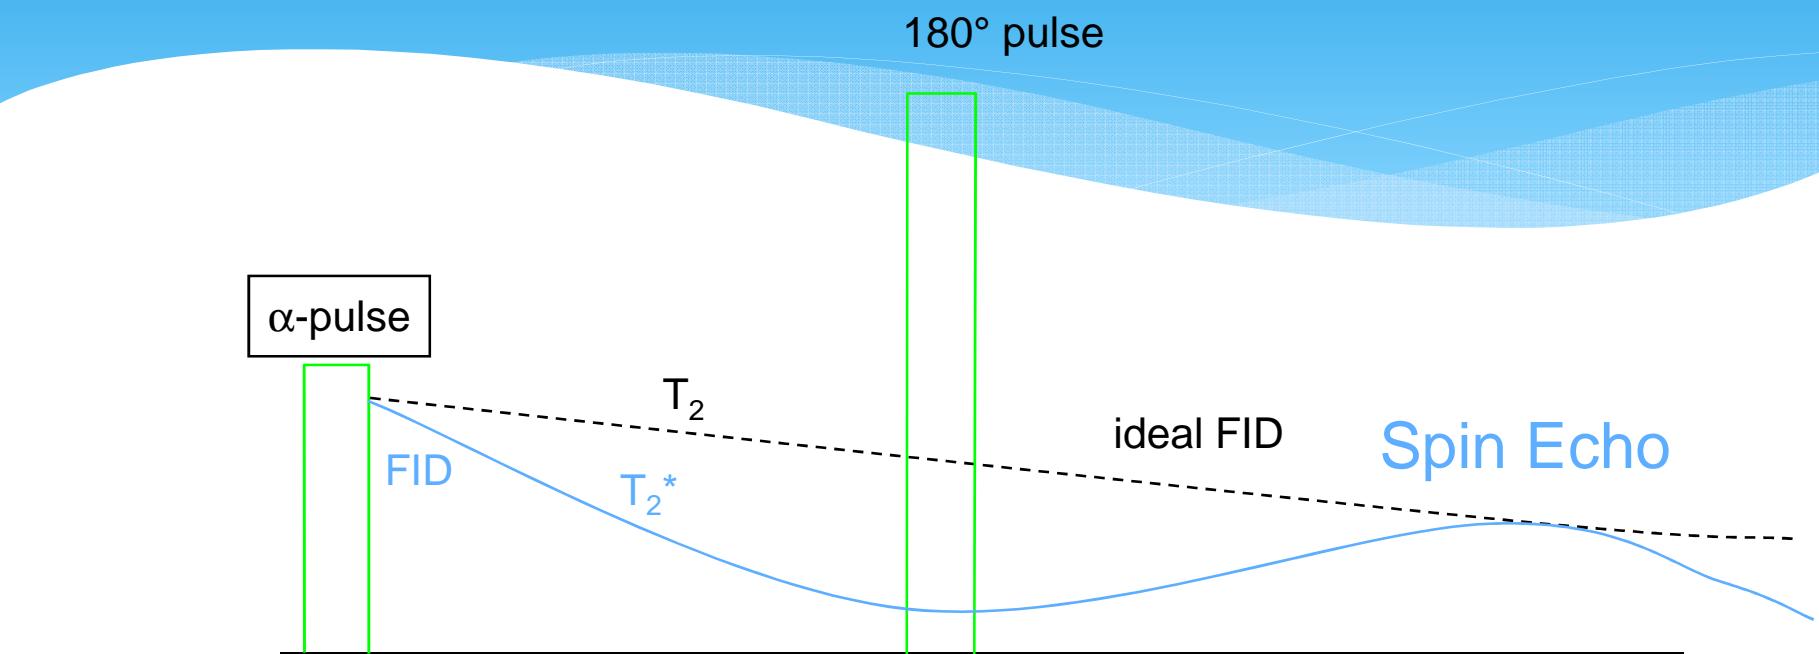

Contrasto nelle Field Echo

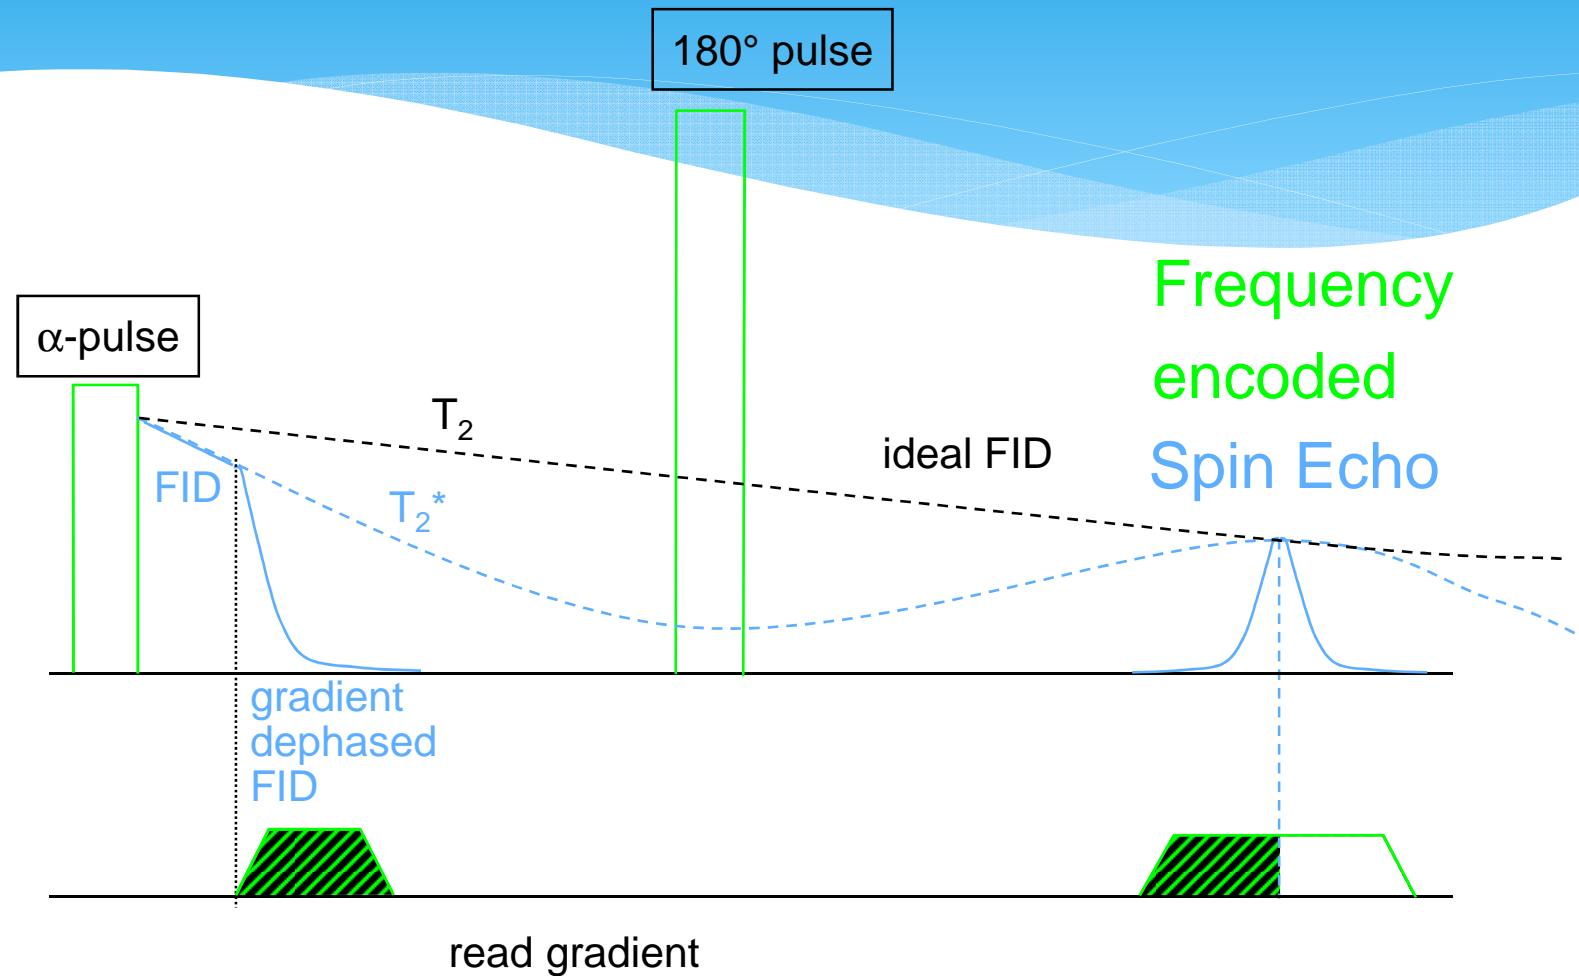

Fast Field Echo (gradient eco)

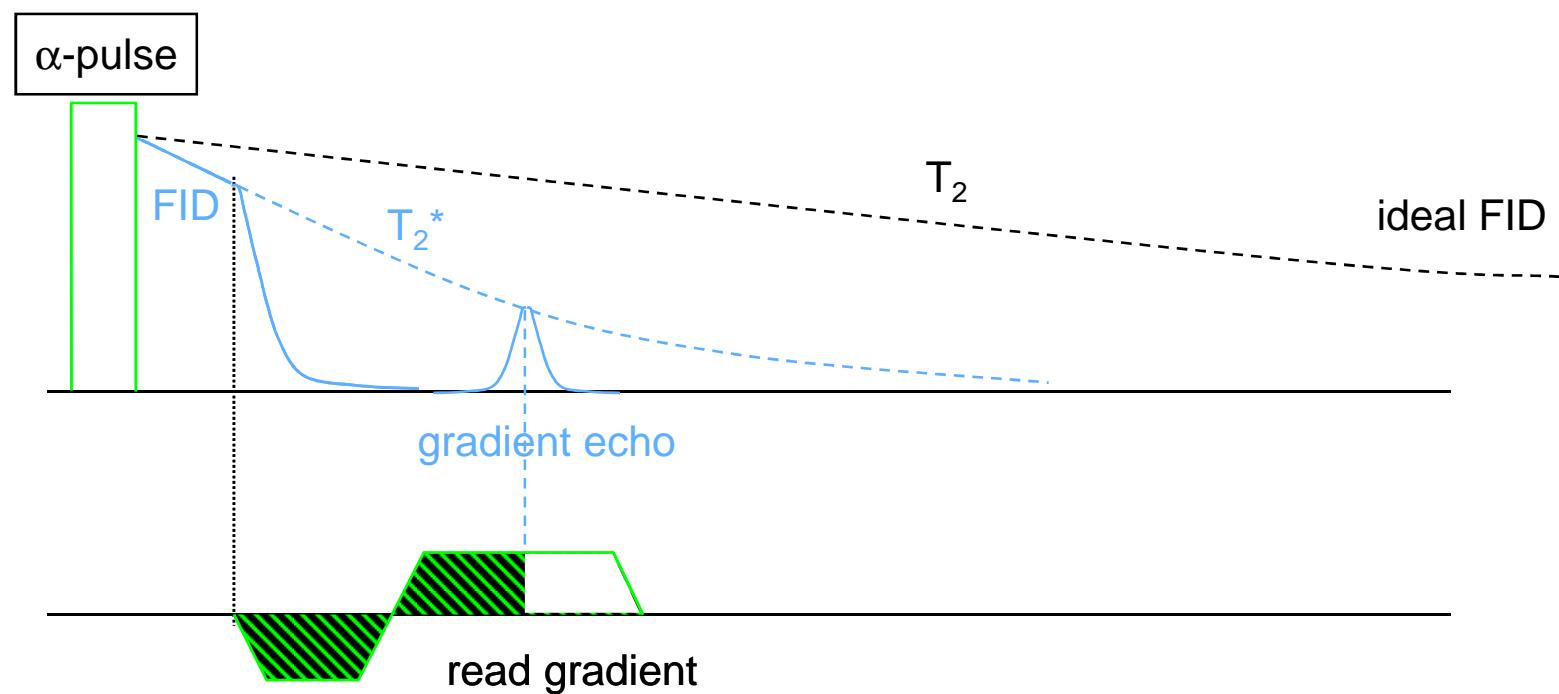

Fast Field Echo (gradient eco)

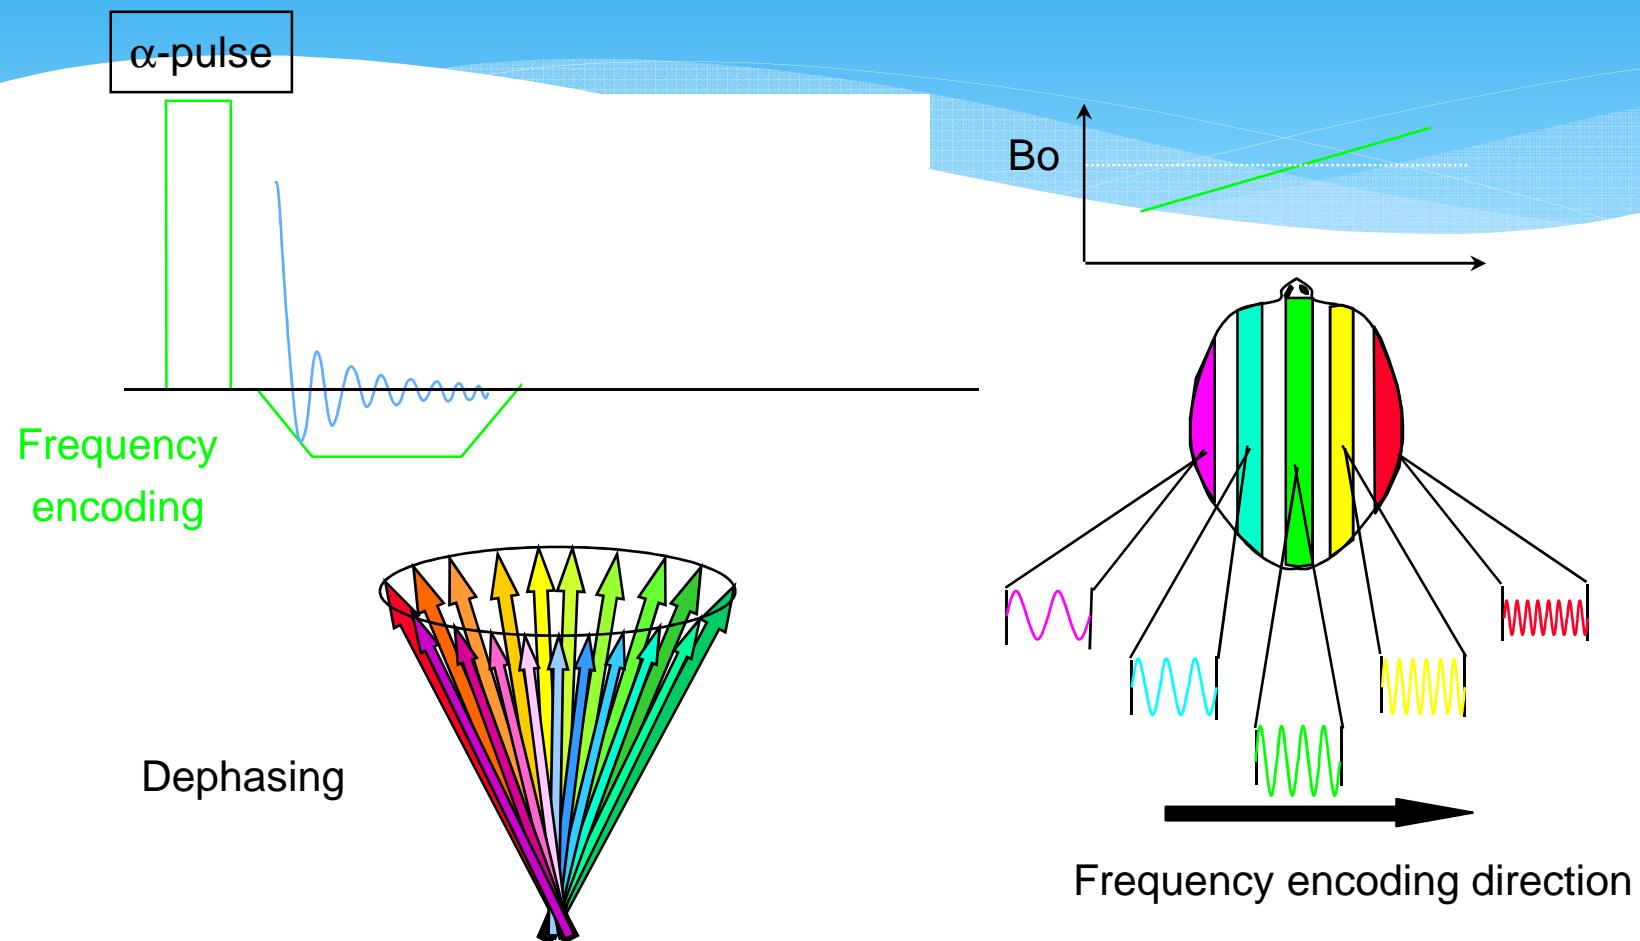

Fast Field Echo (gradient echo)

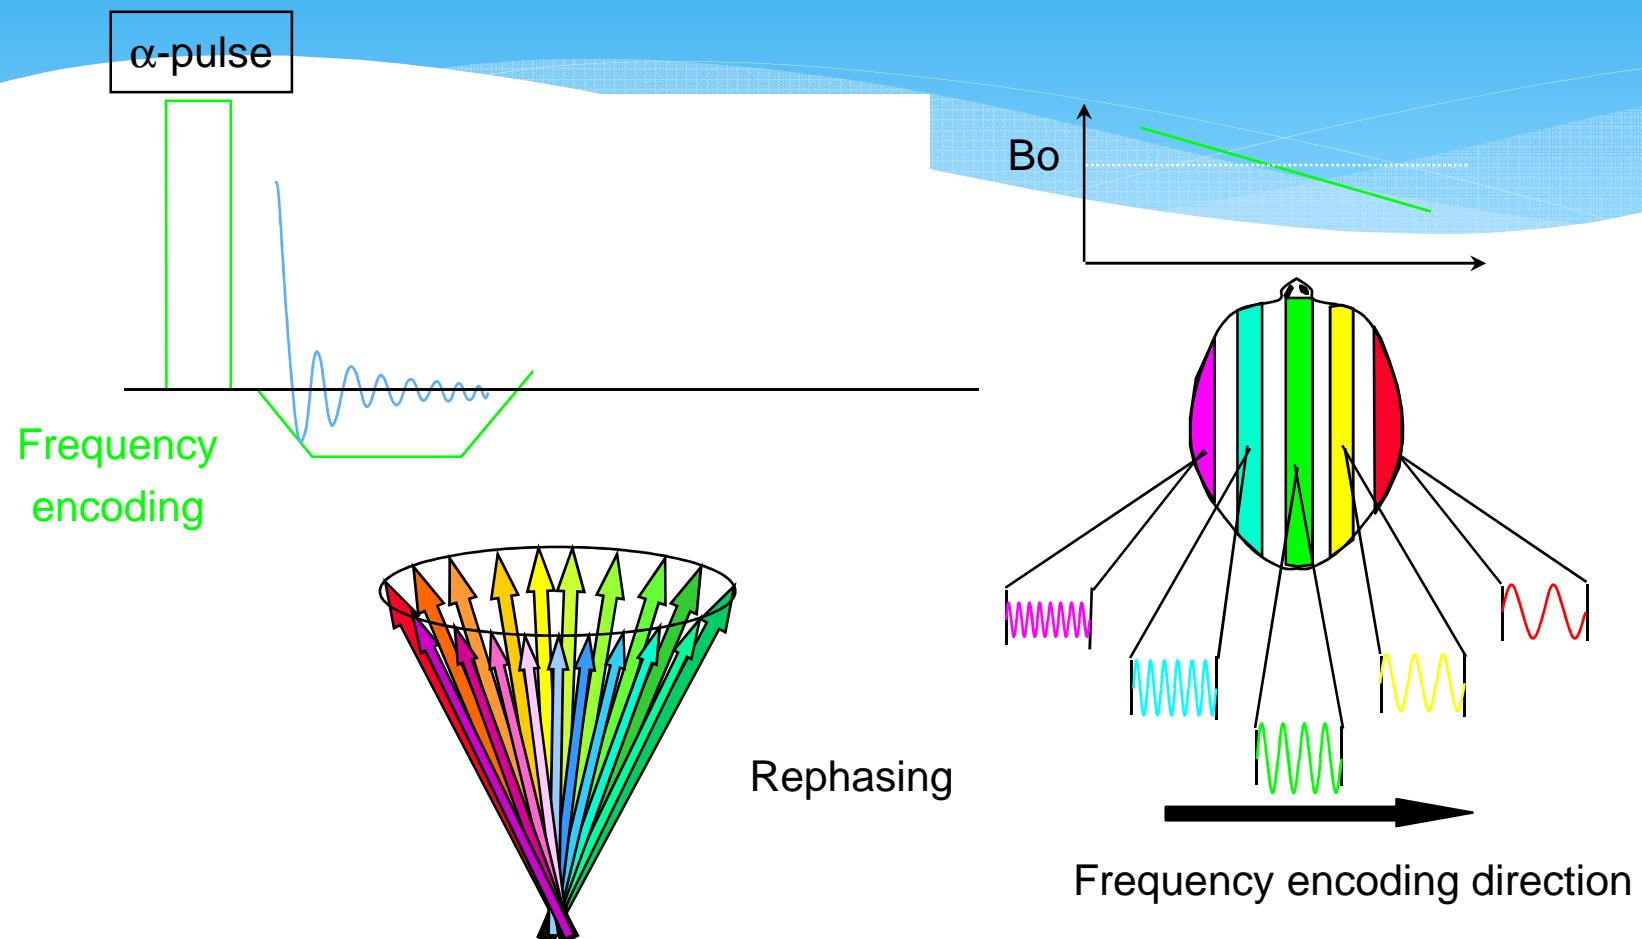

Fast Field Echo (gradient echo)

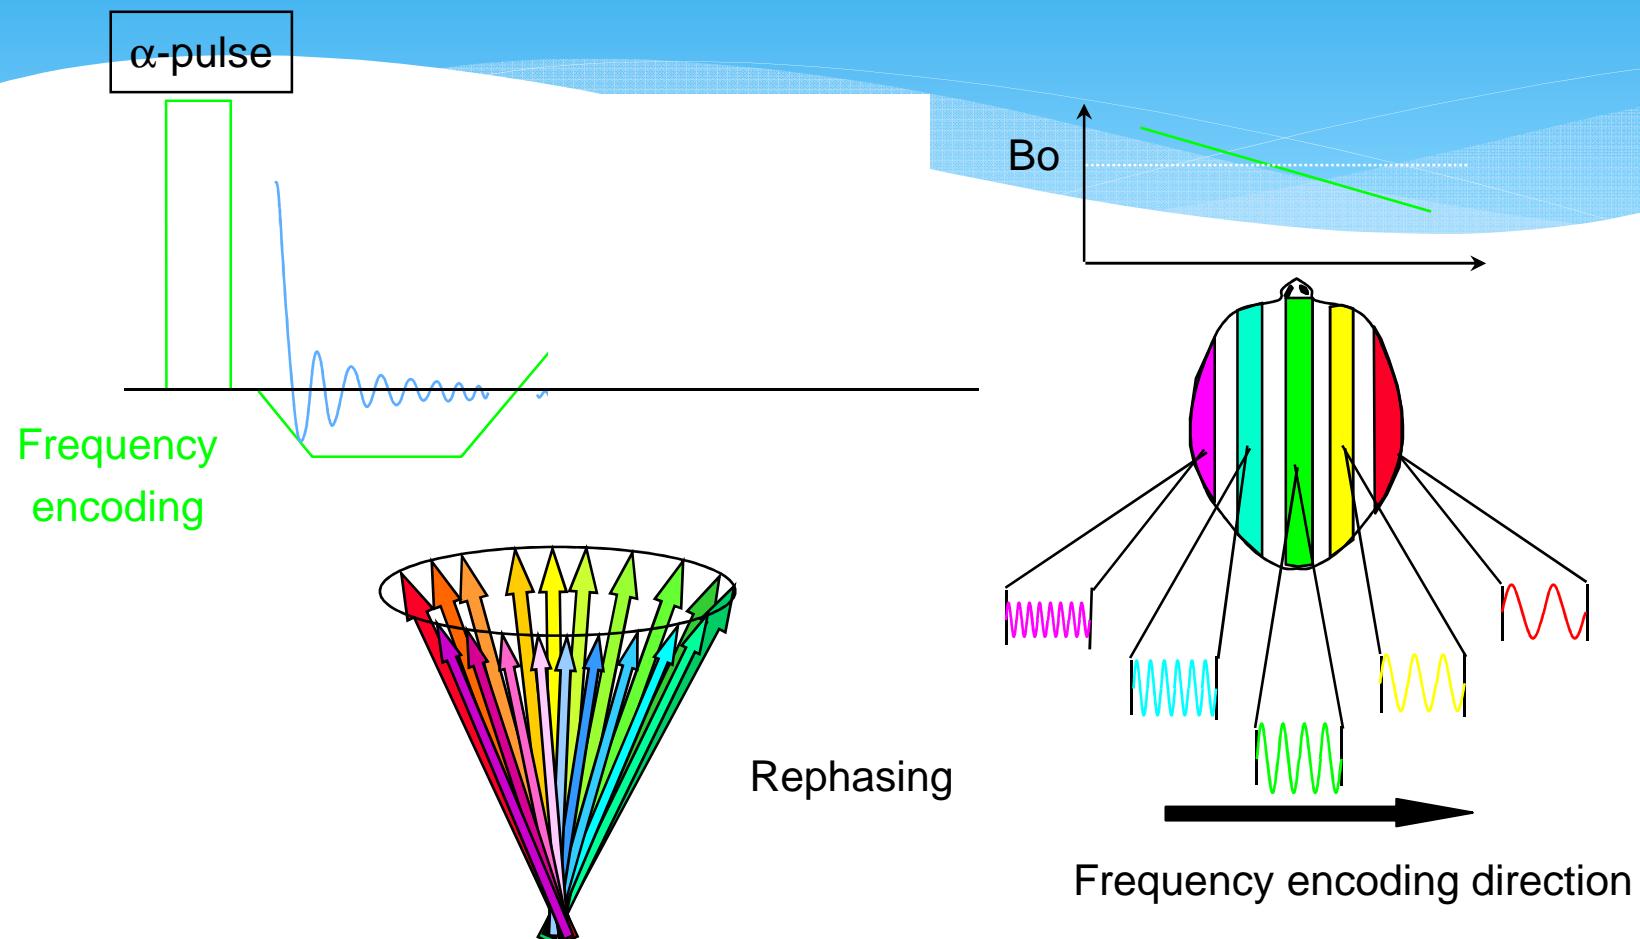

Immagini gradient eco

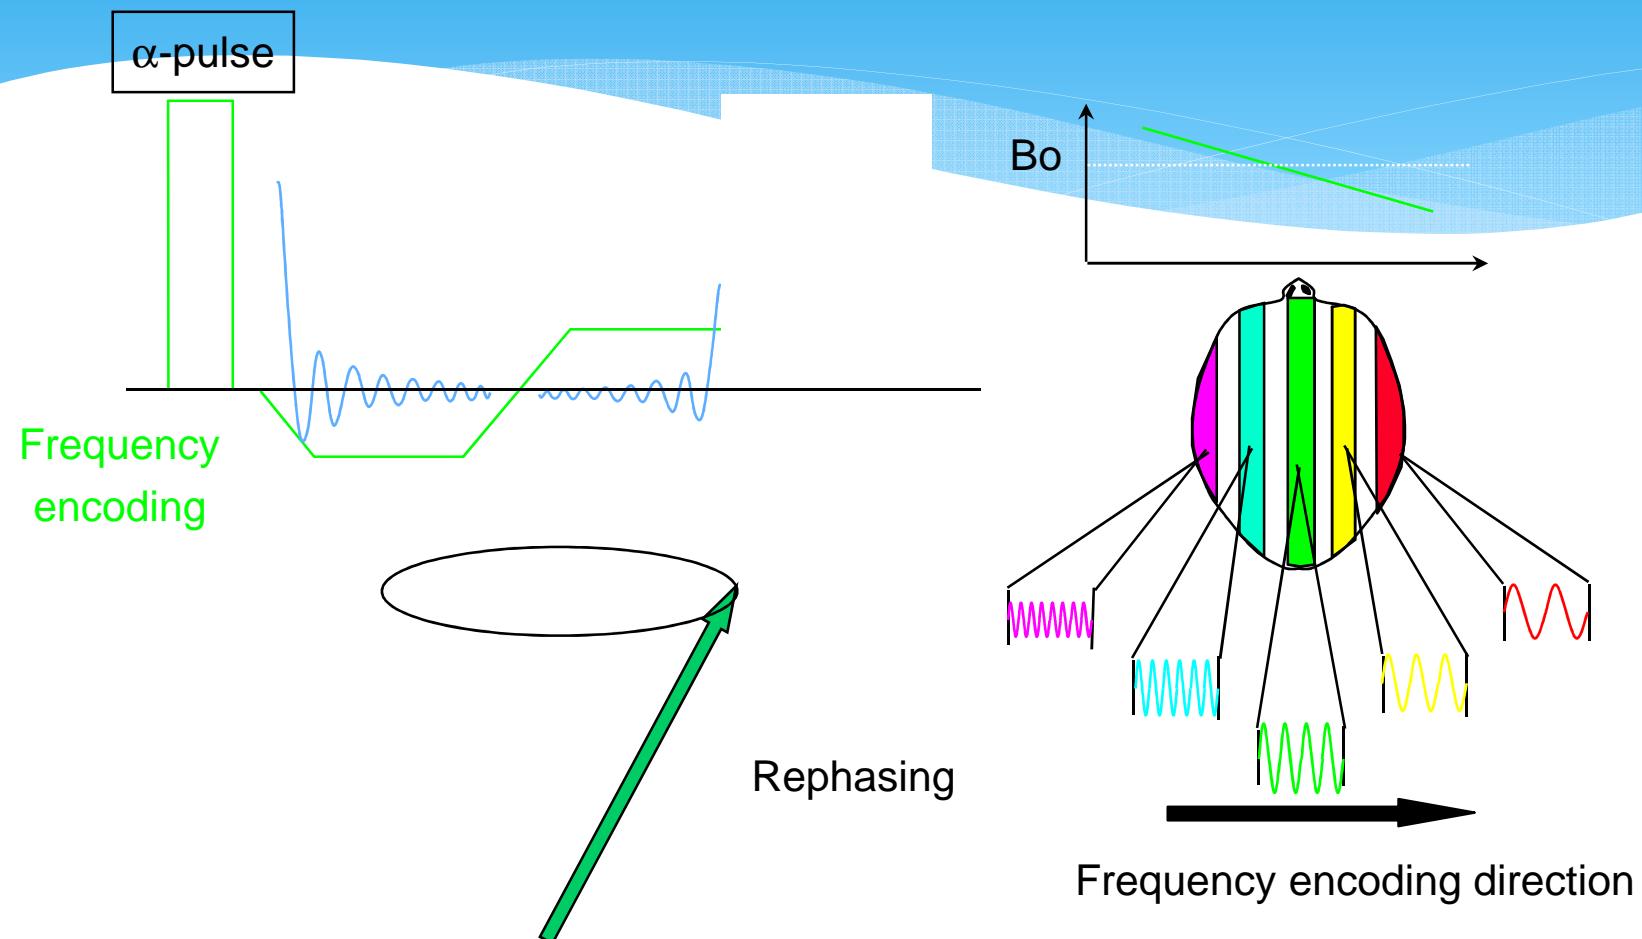

Immagini gradient eco

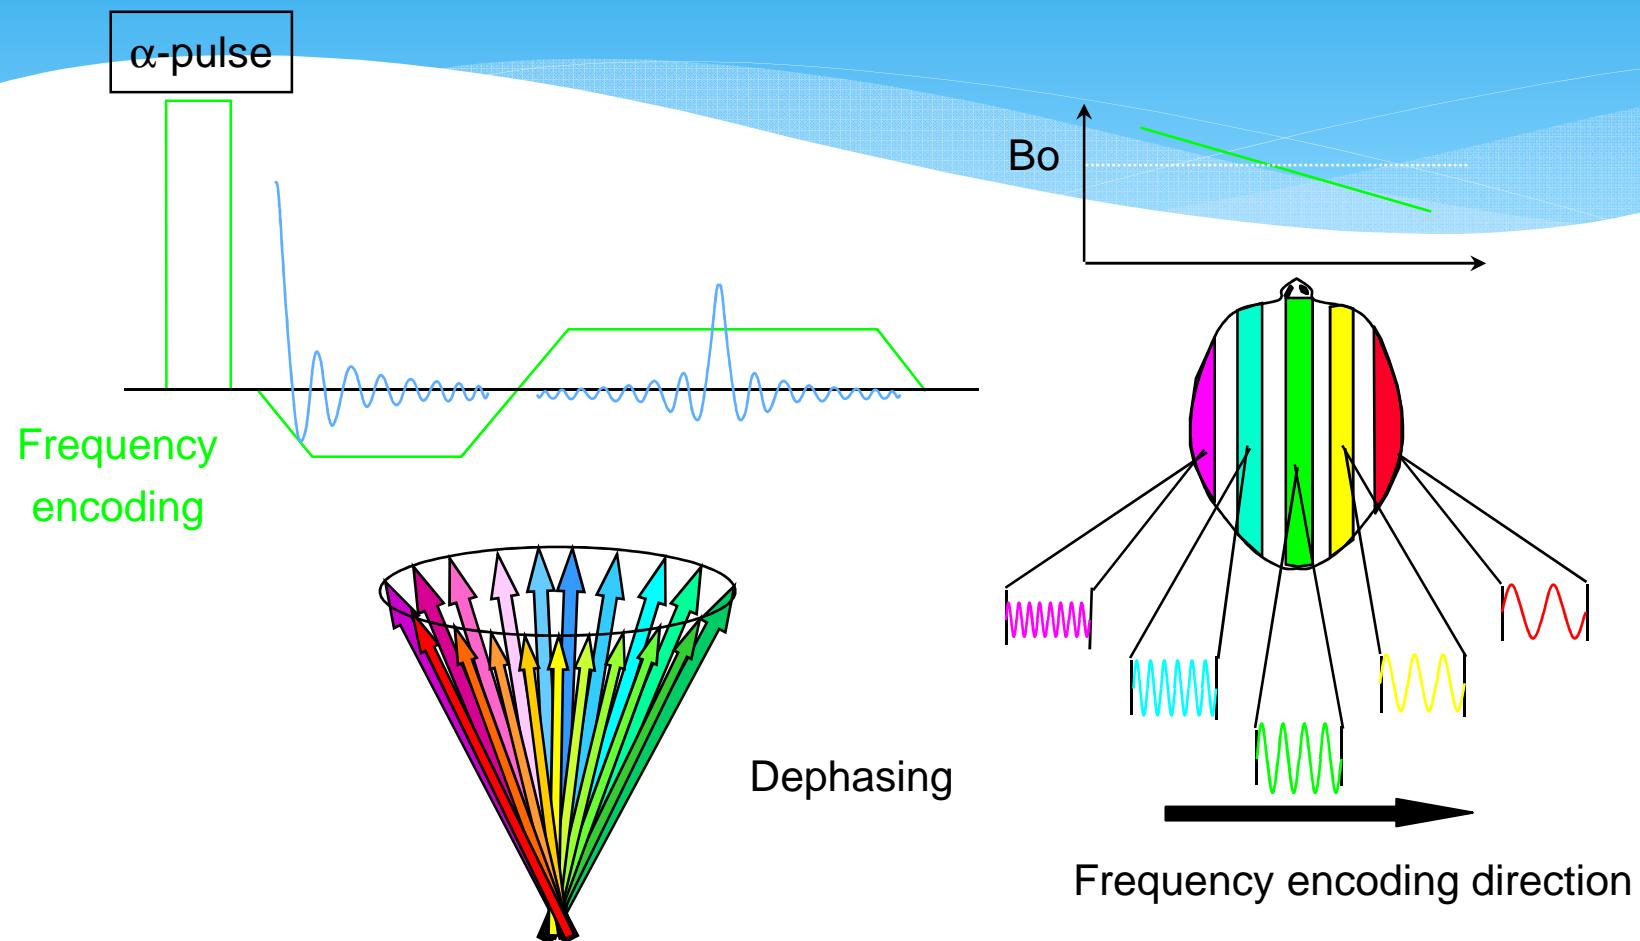

Immagini gradient eco

Immagini gradient eco

Immagini gradient eco

Immagini gradient echo

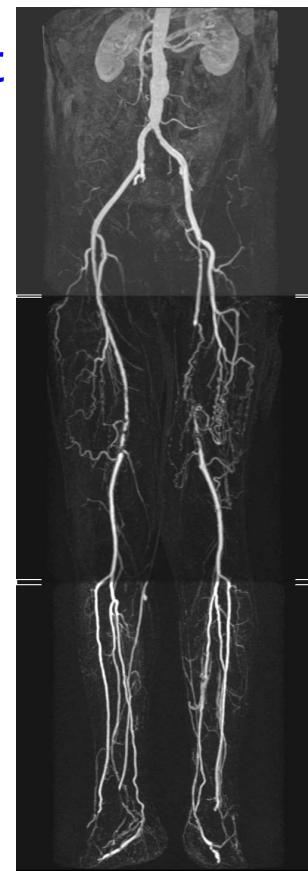

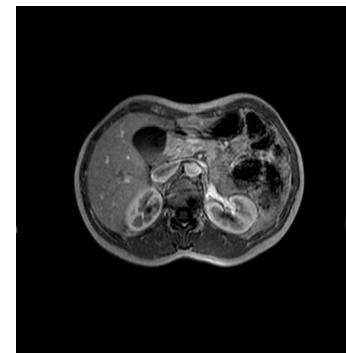

Proprietà

- * tempo di scansione breve
 - per aumentare la collaborazione del paziente
 - per ridurre gli artefatti da movimento
- * bassa esposizione agli impulsi RF
- * $T2^*$ - $T2$ -weighting

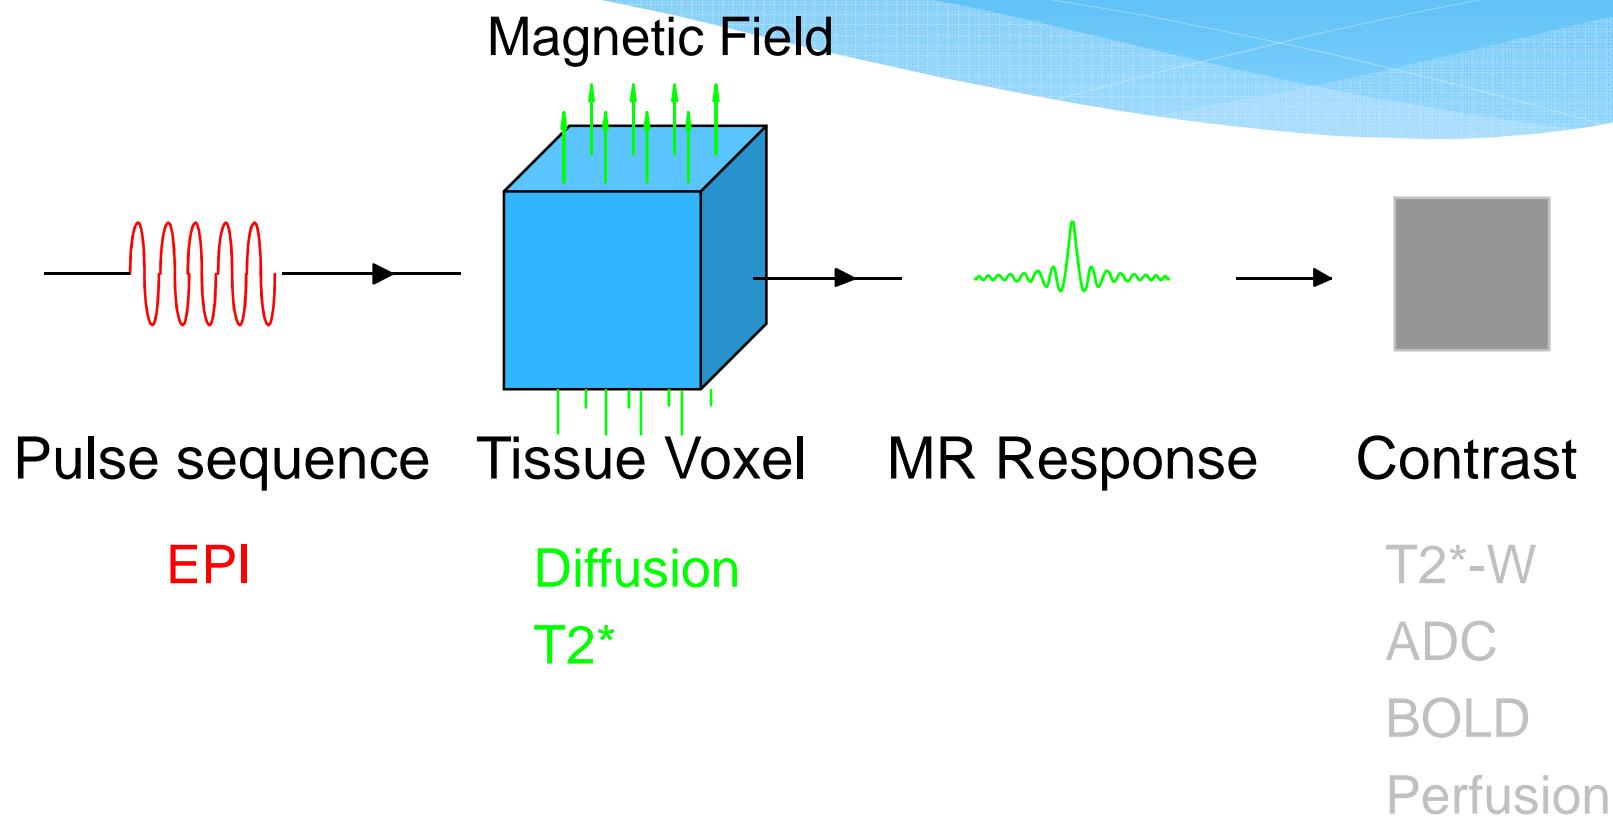

Immagini gradient eco

Tipiche applicazioni delle gradient

- + scansioni volumetriche
- + studi dinamici
- + scansioni in apnea
- + MRA

Contrasto nelle immagini Eco Planari

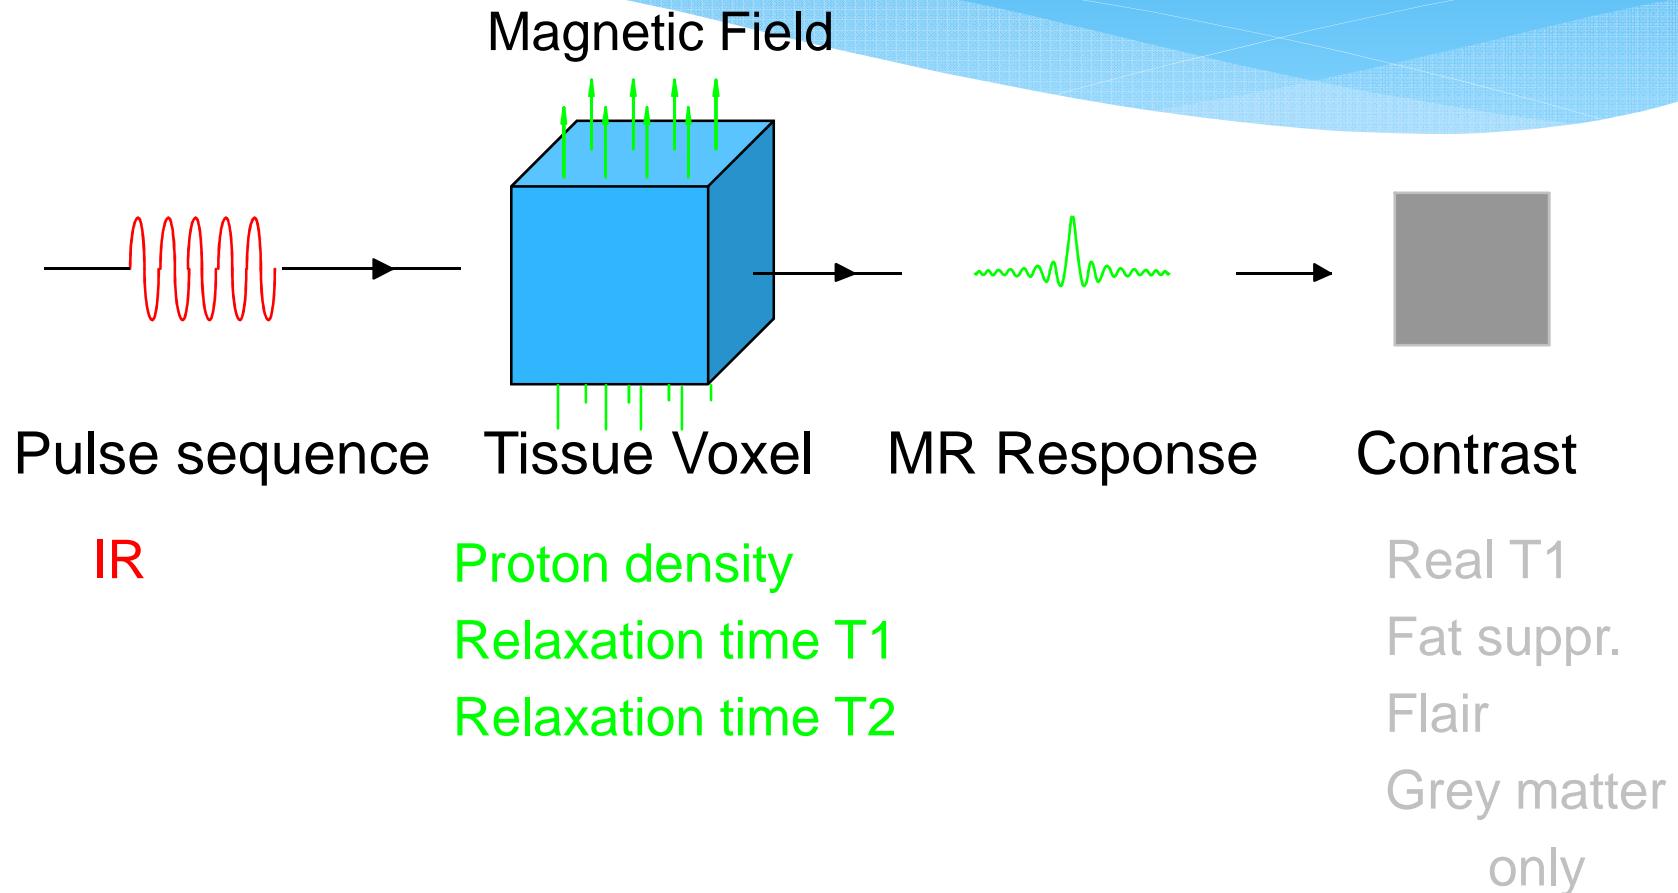

ECHO PLANAR IMAGING (EPI)

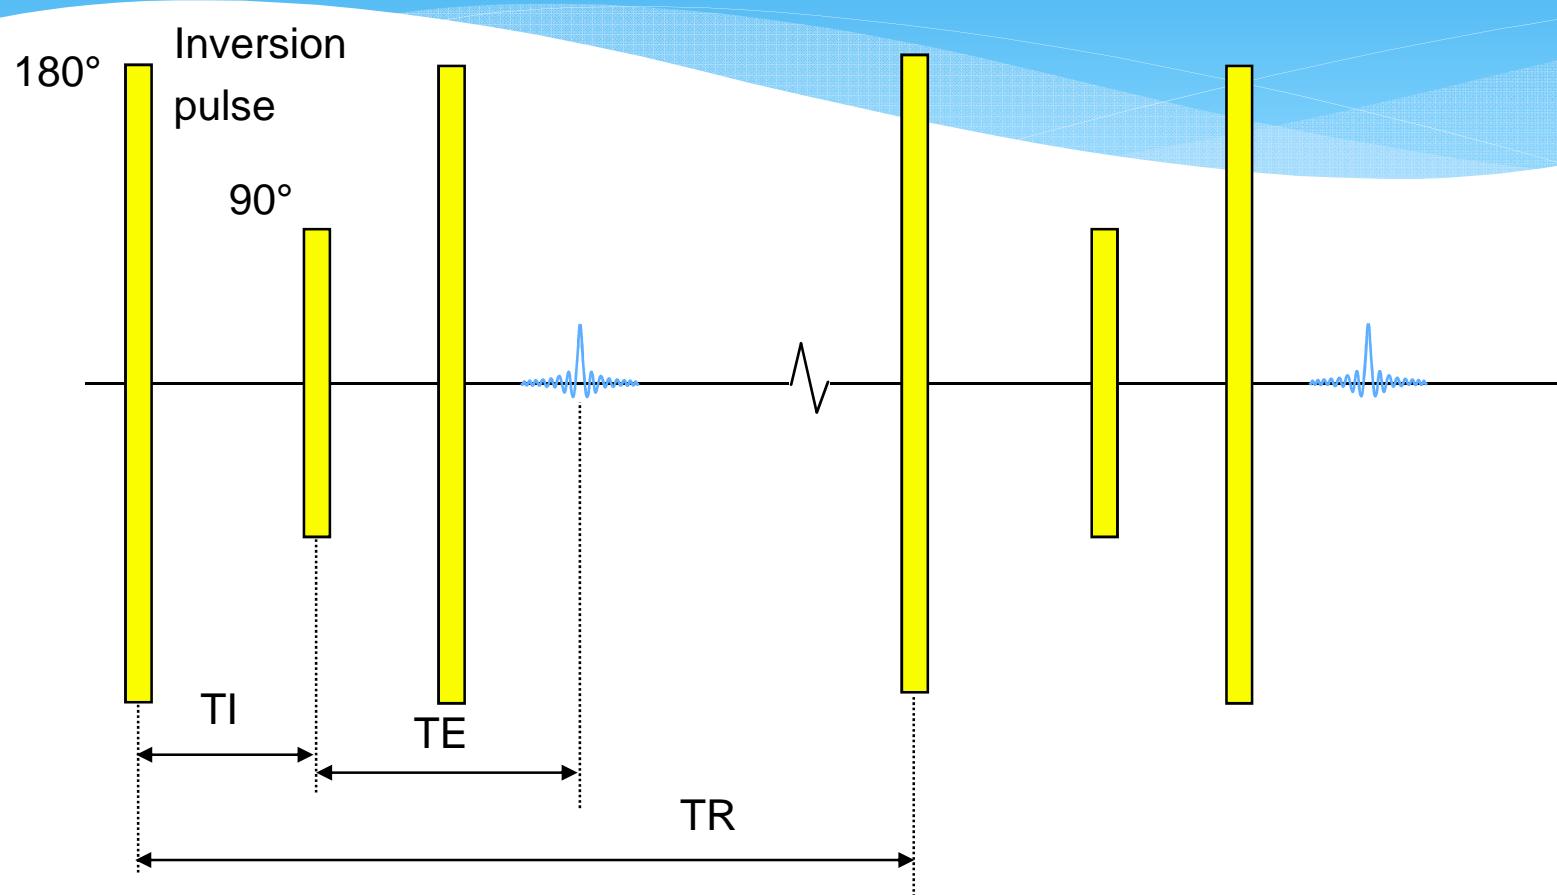

- + Ampio rapporto segnale/rumore con tempèi di acquisizione brevi
- + Tempo di acquisizione 30 -130 ms/ per 1 codifica
- + Sequenze con potenzialità “real time”

- Artefatti (susceptibilità, blurring)
- Alte performance hardware sistema (omogeneità, intensità del gradienti di campo magnetico)

Contrasto nelle IR

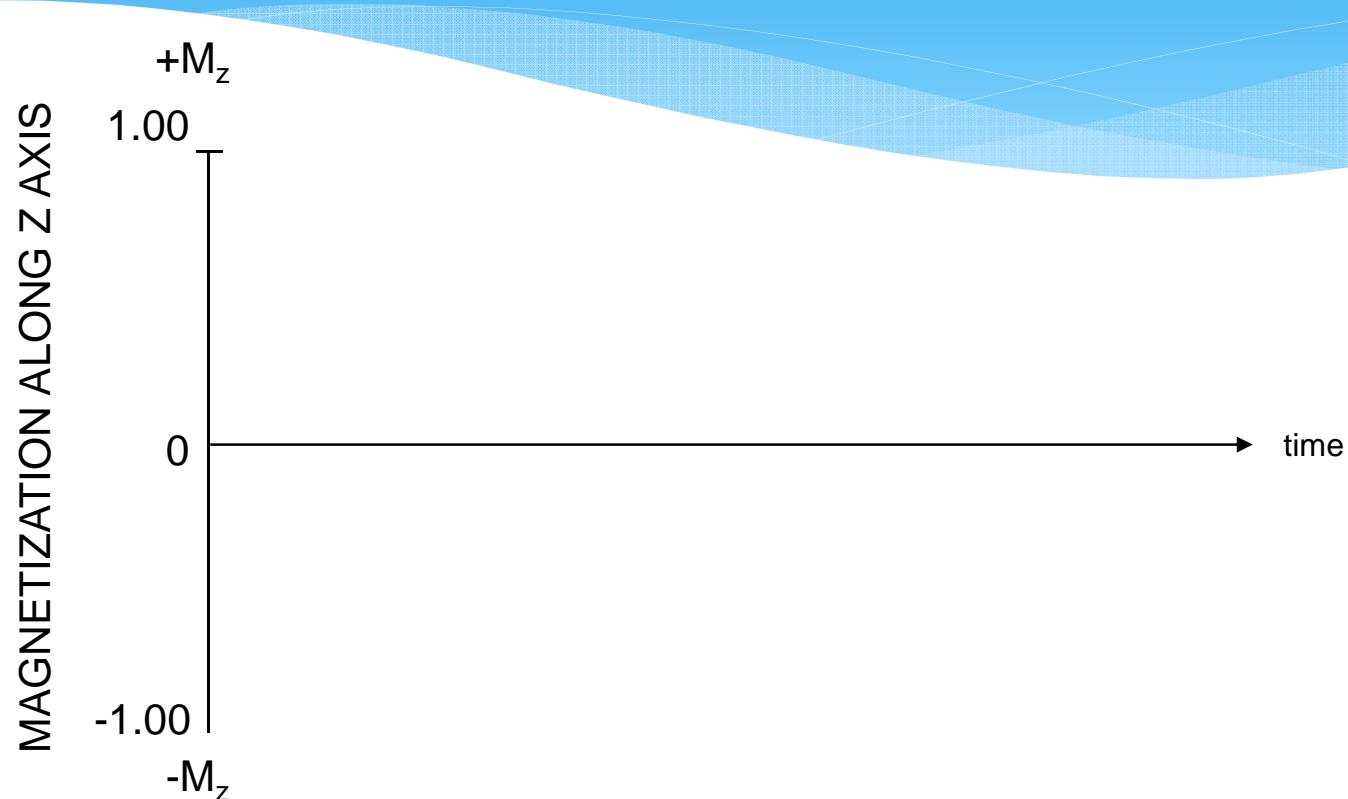

Inversion Recovery (SE con pre-impulso)

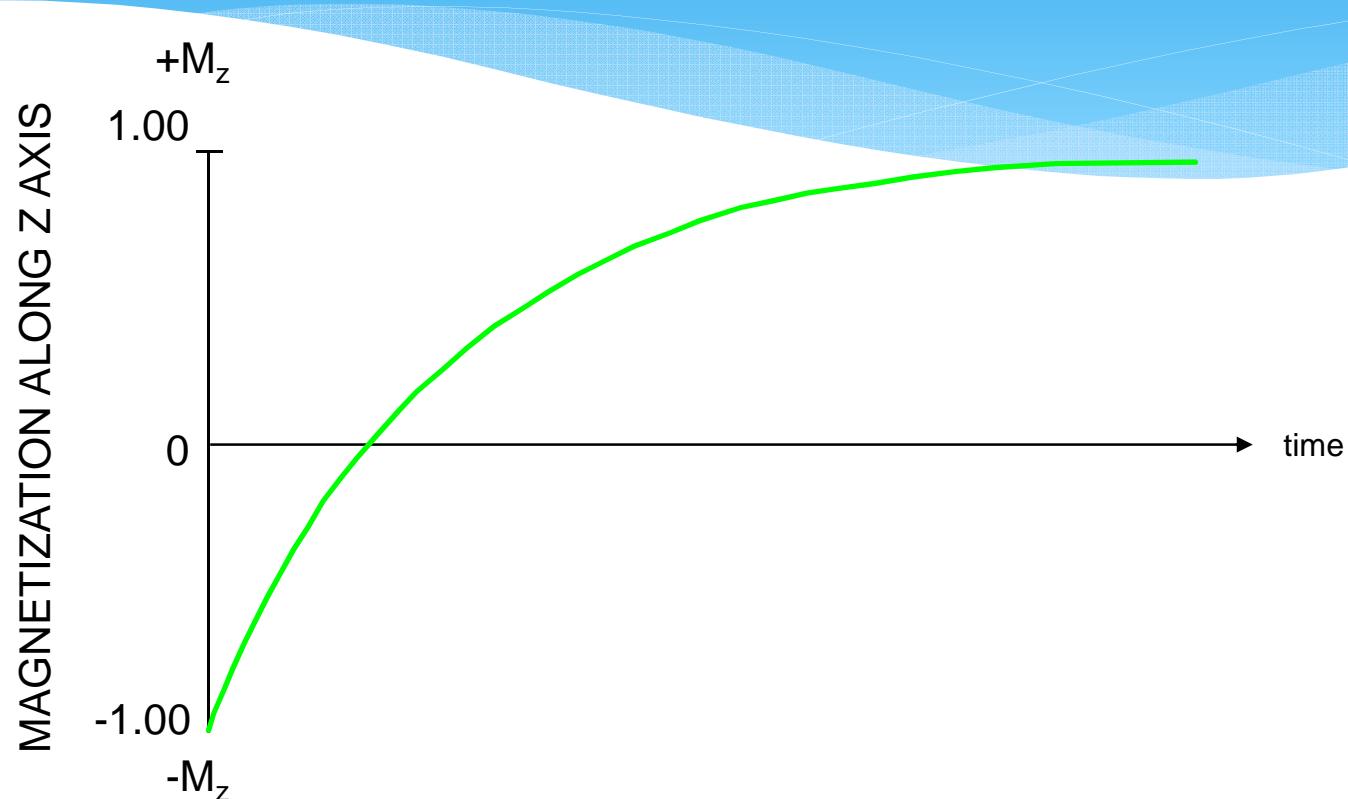

Inversion recovery
